

Ptosis is drooping of upper eyelid.

It can be;

- Congenial
- Aponeurotic or involutional.
- Myogenic ptosis due to myasthenia gravis, CPEO.
- Neurogenic due to third nerve palsy.
- Mechanical due to any lesion on the upper lid.

Symptoms:

- Drooping of upper lid blocking vision.
- Chin up position.
- Amblyopia especially in congenital ptosis.

- Constant use of the eyebrows to lift up the upper lid leading to eye strain, heaviness and tiredness.

Treatment:

- Almost always surgical.
- Congenital ptosis: Frontalis flap surgery
- Frontalis flap plus levator resection surgery.
- Frontalis sling surgery.
- Maximal levator resection surgery.
- Fascia Lata sling surgery.

Aponeurotic ptosis:

- Levator advancement

- Levator resection.

Myogenic and neurogenic ptosis:

- Crutch glasses.
- A variety of surgeries can be considered depending upon the levator muscle function like; levator resection or frontalis sling, frontalis flap etc.

Mechanical ptosis.

- Treatment of the underlying cause.
